The sequences are useful in the diagnosis, prevention and treatment of diseases including infections, pain, cancer, diabetes, amorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypotrension, urinary retention, osteoporosis, angina pectoris, myocardial infearction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders such as anxiety, schizophrenia, manic depression, depression, delirium, dementia and severe mental retardation, and dyskinesias including Huntington's disease and Gilles dela Tourette's syndrome. The present sequence is the HGRL101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            such as micro

The invention relates to novel genes (AAI99548-AAI99604) and proteins (AAM99936-AAM99984) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification

preventing, tre-
food additives
The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides human G protein coupled protein receptor (HGPRP) polypeptides and polymucleotides encoding them. The polypeptides can be produced by standard recombinant methodology. The polymucleotides and polypeptides may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression. Diseases that can be treated are cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis and hepatitis), cancers (e.g. leukemia, melanomas and adenocarcinoma), immune disorders (e.g. ania, asthma and Crohn's disease) and neurological disorders (e.g. epilepsy, Alzheimer's disease and parkinson's disease). The anti-hGPCR antibodies may also be used as diagnostic agents for detecting the presence of HGPRP polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). Sequences AAY57283-288 represent the HGPRP polypeptides.

                                                                                                                                                                                            The invention relates to human G protein-coupled receptor (GPCR) and their corresponding DNA molecules. GPCR is also referred as seven transmembrane receptor. G protein-coupled receptor protein is useful for reating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating schizophrenia. These compounds are also useful for treating schizophrenia. These compounds are also useful for treating schizophrenia and psychiatric diseases, e.g. depression, anxiety, bipolar disease, affective disorders, attention deficit hyperactivity disorder/attention deficit disorder, epilepsy, neuritis, neurosthy, neuropathy, neurosis, Alzheimer's disease, parkinson's disease, migraine and senile dementia. The invention also provides genetic screening procedures that entail analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR's. The present sequence is human CON222 G protein-coupled receptor (GPCR) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seven transmembrane receptor polypeptides and polynucleotides, useful for treating neurological or psychiatric disorders, e.g. schizophrenia, as well as for identifying compounds useful for treating schizophrenia
                                                                                                                                                                    Sequence

The LGR4, LGR5 and LGR7 proteins are used to identify ligands for the receptor. The polypeptides and/or polynucleotides are also useful for homologous or related genes, producing compositions that modulate the expression or function of the receptors, gene therapy, mapping functional regions of the receptors, studying associated physiological pathways, in vivo prophylactic and therapeutic purposes, as immunogens for producing antibodies, and for identifying biologically active agents. The polypeptides contain a G-protein coupled seven transmembrane regions capture and facilitate optimal orientation of its ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 2; Fig

The LGR4, LGR5 and LGR7 proteins are used to identify ligands for the receptor. The polypeptides and/or polymucleotides are also useful for homologous or related genes, producing compositions that modulate the expression or function of the receptors, gene therapy, mapping functional regions of the receptors, studying associated physiological pathways, in vivo prophylactic and therapeutic purposes, as immungens for producing antibodies, and for identifying biologically active genes. The polypeptides contain a G-protein coupled seven transmembrane region and a leucine rich repeat extracellular domain. These regions capture and facilitate optimal orientation of its ligand. The proteins are also expressed in diverse tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 1999-591074/50.

                                                                                                                                                                                                                                                 The invention describes an isolated nucleic acid molecule (I) encoding a covel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a continuoum condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative conditions arrest, cerebrovascular disorders e.g. cardiovascular disorders e.g. angiogenesis, nervous system disorders e.g. Alzheimer's disease and campiotrophic lateral sclerosis, infections caused by bacteria, viruses e.g. acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. corneal infection, gastrointestinal disorders e.g. dysphagia, cadenocarcinomas and irritable bowel syndrome, reproductive system conditions e.g. testicular feminisation, endocrine disorders e.g. diabetes can alsorders e.g. malignancies, cause with a disorders at the cellular level e.g. cerepiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. cutte kidney failure and blood related disorders e.g. malignancies, caute kidney failure and blood related disorders e.g. myocardial coll proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The collypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,
                                                                                                                                                                                                                                                             융

The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, altoimmune haroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as wyotal, bacterial, fungal and parasitic infections.
                                                                                                                                                                                                                                     Matches

These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention.

The polynucleotide sequences of the invention are also useful in gene therapy. AAU18094-AAU18152 represent novel human uterine motility-association polypeptides.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Sequences AAU18282-AAU18507 represent endocrine polypeptides of the invention. Endocrine polypeptides and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polynucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, and a cardiac arrest of the breast of the presence of a mutation in an endocrine as rheumatoid arthritis, hyperproliferative disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, and the presence of the breast of the presence of the

The polypeptides can also be used to aid wound healing, to prevent skin aging the to sunburn, to maintain organs before transplantation, to regenerate elissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

      The invention relates to novel nucleic acids and polypeptides useful fidingnosing, treating, preventing and/or prognosing disorders related these polypeptides. The polynucleotides are especially useful in the diagnosis, prognosis, prevention and/or treatment of diseases which include kidney disorders (e.g. renal failure or nephritis), cardiovascular disorders (e.g. hypertension or myocardial infarction), blood disorders (e.g. annemia or blood coagulation disorders), electrolyte imbalance disorders (e.g. hyponatraemia or hyperkalaemia), neoplastic disorders (e.g. nephroma or renal cell cancer) autoimmune diseases, cancers, inflammatory diseases, reproductive system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-NOV-2000;

AAU18644-AAU18715 represent the novel human renal and cardiovascular-associated amino acid sequences of the invention. Note: The sequence data for this pate did not form part of the printed specification, but was obtained in electronic format directly from WIPO at: ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and cDNA (AAS34767-AAS35050) and DNA CS sequences encoding for these polypeptides. The sequences of the cinvention are useful in the diagnosis, treatment, prevention and/or CC invention are useful in the diagnosis, treatment, prevention and/or CC concer, brain stem glioma, adult liver cancer, childhood cerebellar CC cancer, brain stem glioma, adult liver cancer, childhood cerebellar CC cancer, brain stem glioma, adult liver cancer, childhood cerebellar CC castrocytoma, or Hodgkin's lymphoma). The sequences of the invention may CC also be useful for treating other disorders such as neural disorders, cardiovascular disorders, CC immune system disorders, muscular disorders, reproductive disorders, CC gastrointestinal disorders, muscular disorders, reproductive disorders CC also useful in gene therapy. AAI21568-AAU21851 represent the novel human CC neoplastic disease associated polypeptides of the invention are CC neoplastic disease associated polypeptides of the invention. CC specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

S40241

G protein-coupled receptor - great pond snail
C; Species: Lymnaea stagnalis (great pond snail)
C; Date: 06-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 15-Jun-2001
C; Date: 06-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 15-Jun-2001
C; Accession: S40241
R; Tensen, C.P.; Kesteren, E.R.; Planta, R.J.; Cox, K.; Burke, J.F.; Heerikhuizen, H.; Vresubmitted to the EMBL Data Library, June 1993
A; Description: A G protein-coupled receptor with LDL-binding motifs suggests a role for 34, A; Accession: S40241
A; Accession: S40241
A; Status: preliminary
A; Molecule type: mRNA
A; Scatus: preliminary
A; Molecule type: mRNA
A; Scatus: preliminary
A; Molecule type: mRNA
